Backend engineer with six years building payment and settlement systems, most recently owning the reconciliation service at a Series B fintech. Comfortable where correctness matters more than throughput. Increasingly working on ML-backed fraud scoring.

EXPERIENCE

Senior Backend Engineer

Mar 2022 – Present

Danal Fintech, Seoul

- Own the settlement service reconciling ~400,000 card transactions daily against six acquirer statements.
- Rebuilt the matcher after a partial-capture assumption caused 4,100 false exceptions in one night; cut steady-state exceptions from ~900/day to under 200.
- Introduced idempotency keys across the payment API after a retry storm double-charged 1,100 customers in March 2023.
- Led migration from a nightly batch to streaming reconciliation, cutting dispute resolution from 48 hours to under 4.

Backend Engineer

Aug 2019 – Feb 2022

Kakao Commerce, Pangyo

- Built the order-state machine behind checkout, handling ~2M orders/month at peak.
- Diagnosed and fixed a timezone bug in the nightly settlement job that mis-dated any transaction settling after 16:00 KST.
- Reduced p99 checkout latency from 840ms to 310ms by removing a synchronous inventory call.

Software Engineer

Jul 2018 – Jul 2019

Naver Pay, Seongnam

- Maintained internal ledger tooling; wrote the first integration test suite for the ledger service.

SELECTED PROJECT

Fraud scoring prototype

2024

- Trained a gradient-boosted model on 18 months of chargeback data; shadow-deployed against the rules engine for six weeks.
- Held it back from production after precision fell below the rules engine on the cases that mattered most.

EDUCATION

BSc, Mechanical and Aerospace Engineering

2014 – 2018

Seoul National University

SKILLS

Languages	Go, Python, TypeScript, SQL
Data	PostgreSQL, Kafka, Redis, Spark
ML	PyTorch, scikit-learn, XGBoost
Infrastructure	Kubernetes, Terraform, AWS
Domain	Payments, settlement, reconciliation, PCI DSS
